CCF-5 Carbonated Can Filler and Seamer

Our new CCF-5 Can Filler and Seamer uses true pre-purge filling technology in controlling fills. The CCF-5 can fill 12 OZ cans at nominal speeds up to 40 cans per minute depending on product pressure and temperature.

Container handling is fully automatic – no manual loading or unloading of cans. When ready, the cans are shuttled over and stopped under the fillings heads. A CO₂ douse floods the can and removes atmosphere prior to fill. Our filling heads use genuine liquid pinch valves to control product flow. Flow meters on each head allows for fine adjustments of the fill height on an individual level preventing excess waste. When complete, the cans are transferred over to the seaming conveyor where they receive a CO₂ drip to remove any atmosphere from the open can. A lid is placed onto the top and the can is seamed. After completion the cans exit over to an accumulation table for pack off.
